PROFESSIONAL SUMMARY

High-performance Backend, DevOps, and Systems Engineer specializing in low-level C++ systems architecture, Python automation, and complex cloud-native application deployment. Technical founder with a deep understanding of full-stack monorepo environments, algorithmic data parsing, and AI framework integration. Adept at handling rigorous code evaluations, debugging framework-specific abstractions, memory management optimizations, and server-authoritative logic. Seeking to leverage advanced technical evaluation skills for high-tier AI code optimization and architecture training roles.

SKILLS

- **Languages:** C++, Python, SQL (MySQL/T-SQL), C#, Java, JavaScript/TypeScript
- **AI Integration & Web Architecture:** LLM API Integration, Dynamic Token/Prompt Engineering, Next.js Monorepos, React Native, RESTful Microservices, Data Serialization (JSON/Protocol Buffers)
- **Infrastructure & DevOps:** CI/CD Pipelines (GitHub Actions, Jenkins), Terraform, Docker (Containerization), Nginx, Cloud Deployment (Vercel, Azure, AWS), Perforce (Helix Core), Git
- **Concepts Core Competencies:** Algorithmic Data Curation, Server-Authoritative Logic, Database Normalization (3NF), Low-Level Memory Management, Network Protocols (TCP/UDP, RPCs), Automated Log Parsing (Regex)

TECHNICAL AND FOUNDER EXPERIENCE

Founder & Lead Systems Architect | The Veil

April 2026 - Present

- **Architected** and deployed The Veil (TheVeilWedding.com), a privacy-first, full-stack software ecosystem featuring a unified command center across Next.js web applications and React Native mobile clients hosted on Vercel.
- **Engineered** an automated backend template engine allowing users to clone and inject complex, nested relational data structures (Master Blueprints containing distinct budgeting, vendor, and task models) via atomic database transactions.
- **Developed** an AI DJ Engine utilizing background processing pipelines to ingest Spotify API metrics, mapping track attributes (tempo, energy, genre constraints) into chronologically sequenced, algorithmic event timelines.
- **Designed** and integrated an automated Algorithmic Venue Scouting data utility that parses unstructured geographic and pricing data to instantly calculate dynamic cost estimates and flag complex, hidden vendor compliance rules.
- **Enforced** an absolute zero-data-selling security posture by implementing row-level data isolation, secure encryption layers, and distinct sub-network authentication rules separating public social metadata from private financial data.

Systems Programmer | UE5 Multiplayer FPS Framework

Sept 2025 - Present

Solo Developer | C++

- Architected a scalable, data-driven framework in C++, prioritizing modular component design, memory management, and server-authoritative logic.
- Engineered a custom lag compensation system for hit-scan weapons, rewinding server-side hitboxes to match client timestamps for fair competitive play.
- Implemented strict client-side prediction and server-validation logic to securely manage real-time data replication while awaiting authoritative server responses.
- Integrated EOS (Epic Online Services) to handle matchmaking tickets, lobby creation, and peer-to-peer connection traversal.

Cloud Security & Infrastructure DevOps | Nexus Platform

Jan 2026 - March 2026

- **Authored** clean, modular Terraform files to declare and provision isolated cloud architecture on Azure, handling Virtual Network subnets, Linux Web Apps, and Azure Container Registries.
- **Implemented** zero-trust backend isolation by wrapping an Azure SQL instance inside strict Virtual Network firewalls, locking out all inbound traffic originating outside the app subnet.
- **Managed** sensitive pipeline secrets natively by configuring Azure Key Vault to dynamically generate, apply, and rotate backend administrator passwords during runtime.
- **Wrote** fully automated GitHub Actions YAML workflows to build, test, multi-stage compile, and push secure Nginx Docker container images upon remote repository updates.

Technical Lead & Infrastructure Admin | Delivery Detonation (UE5)

Jan 2026

Perforce Capstone Team Project, Full Sail University

- **Managed** and administered a remote Perforce (Helix Core) depot server for a multi-developer group building a 3D third-person game, defining branching strategies and manually resolving deep binary merge conflicts.
- **Developed** a server-authoritative session state machine via EOS to prevent client-side state exploitation and handle cross-client state synchronization.
- **Optimized** network bandwidth consumption by designing a customized replication graph, utilizing raw UDP for high-frequency actor translation while reserving Reliable RPC nodes for critical game states.

Database Architect | Security Analysis & Warehouse Optimization (MySQL)

March 2025

- **Designed** a relational schema in 3NF to parse and store raw web server logs, tracking User IPs, Session Durations, and Access Patterns to identify high-traffic events.
- **Wrote** complex SQL scripts to detect security anomalies, identifying potential bot traffic and unauthorized access attempts by analyzing UserAgent strings and IP frequency.
- **Implemented** Stored Procedures and Views to auto-generate daily traffic reports, aggregating raw log entries into actionable metrics for system health monitoring.
- **Optimized** high-volume search queries using Clustered and Non-Clustered Indexes, reducing execution time for complex joins and reducing data redundancy by 60%.
- **Enforced** referential integrity via Foreign Key Constraints and ACID transactions to ensure atomic updates across a 30,000+ record dataset.

Backend Developer | Python Automation & Data Ingestion

Feb 2025

- **Developed** a Regex-based Python utility (LogParser.py) to parse unstructured server access logs, extracting IP addresses, timestamps, and User Agents for immediate database insertion.
- **Engineered** automated security protocols to instantly flag 401 Unauthorized access attempts during the parsing phase before database commitment.
- **Created** NetworkUtils.py to securely fetch remote HTTP data streams, parse HTML node structures, and execute grid-coordinate mapping from unstructured web sources.

EDUCATION

- Bachelor of Computer Science in Game Development

Full Sail University | Winter Park, FL | Graduated March 26th, 2026

- **Core Competencies / Coursework:** Advanced Computer Networks (TCP/UDP socket programming, blocking/non-blocking execution modes), Operating Systems & Systems Programming (Multithreaded race conditions, process scheduling, raw File I/O, and manual data binary serialization layouts).
